

FIELD NOTES

So . . . “Hang Tough Folks”

Project Definition: Work with Mill ownership and management to determine best methods of efficient operation into the future.

Goal: 12 MMBF—15 MMBF Hardwood Mill Production in as few hours as possible, while increasing lumber recovery

Capital Expenditures Priority #1: Automated Machine Grading and Optimization

From one of our satisfied customers:

“Working with Northeast Mill Services to implement a Comact TrimExpert into our production facility has been a huge benefit to our operation. Michael and Scott did a thorough job representing the machinery and its capabilities while providing the site engineering. They were quite upfront about the “homework” we would need to do in advance of installation and what would be required after installation to achieve success. We are glad that we listened to them!! From our initial conversation they have gotten back to us with the answers we needed to have to make informed decisions. The level of flexibility, professionalism, and accountability that Northeast Mill Services & Comact brought to the table helped our project become a major success! This was a complex project with multiple vendors that came in under budget and on time, and hasn’t missed a beat since start-up, I think that says it all!”

“This was a complex project with multiple vendors that came in under budget and on time, and hasn’t missed a beat since start-up, I think that says it all!”

It takes time to plan a project from initial ideas, through considering options, gathering information, talking with manufacturers and engineers and finally to implementation and start-up. Starting your planning now will give you a head start when the markets improve. Can we help you prepare for your future?
